

building (system) with (Openclaw) to (reclaim time)

(12 hours, poorly spent)

Do you know how time consuming it is to be unemployed? **I do.**

At my peak, I was spending 12 hours per day searching and applying for jobs. I'd start at 9AM (you don't want to get too used to the lifestyle) and sift through hundreds, yes, hundreds of listings on job boards. By 9PM I would have applied for just a couple of roles.

As a career changer who is studying to move into a different field, I had two options. I could finish studying then apply for jobs. This is the clear, sensible route, providing you don't need to pay bills or eat food. Alternatively, I could apply for jobs and study at the same time. Although slower into the desired career path, this option has the considerable upside of keeping my partner happy and the possibility of learning on the job.

I went with the latter... and quickly found out that this option only works if job-hunting and studying can co-exist. Well, not in this climate.

The 12 hours I spent job hunting were 12 hours I wasn't spending on learning and development. It made every rejection letter that bit more painful. I felt stuck.

So what is the solution?

Robots (Three of them.)

Technically AI agents aren't robots, but my team of OpenClaw agents work autonomously, driven by LLMs, to take most of the job-hunting process out of my hands.

I found out about OpenClaw from a friend who works in tech, and couldn't quite believe my ears that there was a tool so useful (and so scary) on the market. Within a couple of hours, I had set up a virtual machine, connected my LLM accounts, and created three agents I could communicate with in Slack.
